Case studies in this document

1. **Closing the gender gap at a B Corp**, ACS Clothing, MSc dissertation
2. **Putting taxis where the demand is**, Haggis Hoppers, MSc group project
3. **Finding the missing 98 officers**, regional police force, Deloitte case study
4. **Clearing technical debt from 16,000 files**, Amadeus Software Labs internship
5. **Solving a cold food complaint pattern**, Blue Lagoon Fish and Chips

How I work

Understand the people who feel the problem, find the pattern in the data, define the change as requirements with owners, test and sign off before go live, then measure the results.

Experience

Dec 2024 to now	Operations and Customer Experience Assistant , Blue Lagoon Fish and Chips, Glasgow
Apr to Sep 2024	Project Manager , Blackmont Consulting
Aug 2020 to Aug 2023	Quality Analyst , Amadeus Software Labs. High Flyer Award
2020	Software Engineering Intern , Amadeus Software Labs
Dec 2018 to Jan 2019	Full Stack Engineer Intern , CodeAsylums, Pune

Education

MSc Business Analysis and Consulting, with Distinction, University of Strathclyde. Bachelor's degree in Information Technology, BIT Mesra.

Interactive version with every case study: <https://inshaismaili.github.io>

ACS Clothing, a sustainable fashion company, had signed the UN Global Compact and Women's Empowerment Principles, but women held only 10% of leadership roles and its B Corp gender score was 11.6%.

Sole consultant and researcher, working with the COO.

- Interviewed 11 staff across five departments and the COO, with ethics approval and anonymity.
- Logged 17 gaps, each with today's state, the goal and an owning team.
- Mapped stakeholders by influence and interest.
- Built cognitive maps for each team, and used topic modelling on the transcripts to confirm themes.

The findings infographic I designed for the client.

17 gaps logged, each with an owner

Four priority recommendations for the COO: a leadership pipeline with mentoring, inclusive team training, women leading sustainability work, and continuous monitoring.

Putting taxis where the demand is

Context

A Glasgow taxi firm allocated drivers without knowing when or where demand peaked, leaving customers waiting at busy times and cars idle at quiet ones.

My role

One of seven team members on the analysis and recommendations.

Actions

- Analysed a month of call data by hour and by day.
- Built a next day hourly demand forecast.
- Mapped pickups and clustered them into five demand zones.
- Linked it all in a balanced scorecard strategy map.

5 demand zones found by clustering

Outcome

Dynamic fleet allocation: forecast the drivers needed each hour and reset cars to the centre of their zone after each trip, backed by lean waste reduction and a driver reward scheme.

Full report:

<https://drive.google.com/file/d/1BaEptnXptYToC-FI3aZeqg8y1mP7VhH/view>

Daily calls in February against the average. Spikes on a bad weather day, Valentine's Day and the last day of the month.

Balanced scorecard strategy map.

Finding the missing 98 officers

Context

Three regional forces faced high vacancies, resignations and a growing digital crime threat. Leadership needed the staffing gap quantified by region and role.

My role

One of eight team members on the data analysis and roadmap.

Actions

- Rebuilt the HR calculations and corrected errors in the client’s own totals.
- Compared planned and actual staffing for every role in every region.
- Used thematic analysis of interviews to explain the numbers.

Where the gaps sat (all forces, FTE)

Role	Planned	Actual	Gap
Detective Constable (P1)	166	96	-70
Police Support Investigator (P1)	73	31	-42
Police Constable (P2)	158	121	-37
Detective Sergeant	57	35	-22
Junior Support Investigator (P2)	78	154	+75

The staff existed, but many sat in the wrong roles: junior support investigators were almost double their plan while detective constables were 70 short.

18% understaffed: 558 planned posts, 460 filled

Outcome

A three phase roadmap: retain and upskill current officers, redesign hiring, and build a digital crime capability using the ADDIE training model.

Clearing technical debt from 16,000 files

Context

A legacy codebase of over 16,000 files still carried old C style patterns, far too many to modernise by hand.

My role

Intern, working independently with a mentor.

Actions

- Ran a feasibility study on ten categories of technical debt.
- Built a Python tool that rewrites code by category, formats and builds it, and raises a pull request for the file owner.
- Spotted files with no owner whose changes merged without review.

Example fix

```
- if (isValid == TRUE)
+ if (isValid)
- if (pBooking != NULL)
+ if (pBooking)
- #include <stdio.h>
+ #include <cstdio>
```

4,729 files and 60,258 lines modernised through 171 pull requests

Outcome

A cleaner codebase, plus a governance fix: 230 ownerless files brought under proper review through six pull requests.

Solving a cold food complaint pattern

Context

Customers kept reporting that delivery orders arrived cold, and the complaints were clustered rather than random.

My role

Ran the analysis and put the change in place.

Actions

- Ran cluster analysis in SPSS on delivery postcodes to group them into areas.
- Matched complaints against those areas to find the pattern.

Outcome

Orders to nearby postcodes now go out together on shared runs, and outlying areas get extra time planned in. The recurring complaint pattern was resolved.

More projects

- **Taking a student housing platform to market**, Blackmont Consulting: primary survey, SWOT, UK compliance and a pilot launch plan.
- **Scoping nuclear energy in Scotland**, Frazer-Nash brief: an 11 month plan using scenario planning and cost benefit analysis. [Full proposal](#).
- **Health insight for smaller Scottish towns**, MSc research: Power BI dashboards on alcohol harm and deprivation across Stirling.
